

Stablecoin Flow Intelligence for Philippine Remittance Corridors on Stellar

"Daloy" is Filipino for "flow."

The rails Filipino families depend on are a black box

\$35.63B

OFW cash remittances in 2025
(record high, 7.3% of GDP)

+1%

new US remittance tax as of 2026,
on ~40% of inflows

0

accessible tools to see Stellar's PH
stablecoin corridors

Stablecoins on Stellar are a cheaper rail — but nobody can see the flows: volumes, cross-currency activity, peg health, or anomalies.

First thing Stellar told me: \$8,800,000,000,000 moved in a day.

That's obviously wrong — and why it's wrong is the whole point.

NAIVE FILTER

\$8.8 Trillion

asset_code = 'USDC'
anyone on Stellar can mint a token called "USDC"

ISSUER-PINNED

~\$778 Million

code + issuer (Circle's verified GA5ZSE...)
-5% of ops, -99.99% of the fake "volume"

Daloy validates data before it charts it. That instinct is the product.

An ELT pipeline + on-chain attestations — on free tiers

Cost engineering, not afterthought

A 30-day scan wanted 71 GB — a per-query circuit breaker caught it before the first build. Daily rebuilds at 30 days = 2.1 TB/month, double the 1 TB free quota. **Fix: sized the window to 14 days (~530 GB/month) + partition & column pruning.**

The live dashboard: USDC flow, in real Stellar data

Whale-flow regime

\$600–750M

for days on end vs a ~\$10–140M
baseline — treasury-scale
movement, obvious at a glance.

\$3.3B total volume • 1.5M payments • updated daily, automatically

Two anomaly species — and count catches what volume misses

Micro-payment swarm

6,300

path payments in ONE day (Jun 27)
moving almost no value — the tall
bar with a floor-level line.

*Likely bots / stress test. A volume-
only view is blind to it.*

Cross-Currency (Remittance-Style) Volume — bars = path-payment count, line = volume

Daloy doesn't just show numbers — it publishes them on-chain

A Soroban attestation contract, deployed to Stellar testnet, publishes daily flow-health records anyone can verify.

```
$ stellar contract invoke ... -- get_attestation --date 20260705
```

```
{ "date": 20260705, "usdc_volume": 7129264,  
  "payment_count": 48542, "is_healthy": true }
```

Real Jul 5 pipeline data — written to Stellar, read back from Stellar.

Contract: CCQR60JVMRLKAT7SMBJK2ZGYGWXLJNO2RIYOP3XEKI2EK45Y26TP3T3M

Composable infrastructure, not a closed app

Open dbt models & gold tables

Other Stellar builders query Daloy's corridor intelligence directly — no rebuilding pipelines.

On-chain attestations

Flow-health records live on Stellar; any dApp can read and compose on them.

Path-payment focus

Isolates the true cross-currency remittance mechanism — the rail OFW families use.

Zero-cost & reproducible

Runs on free tiers with scheduled CI; the whole thing is version-controlled and re-runnable.

Built solo. Zero cost. From Manila.

A full ELT pipeline, live dashboard, statistical anomaly detection, and a deployed Soroban contract
— and it runs itself.
